An exploration of water vessels

# Pre design testing phase

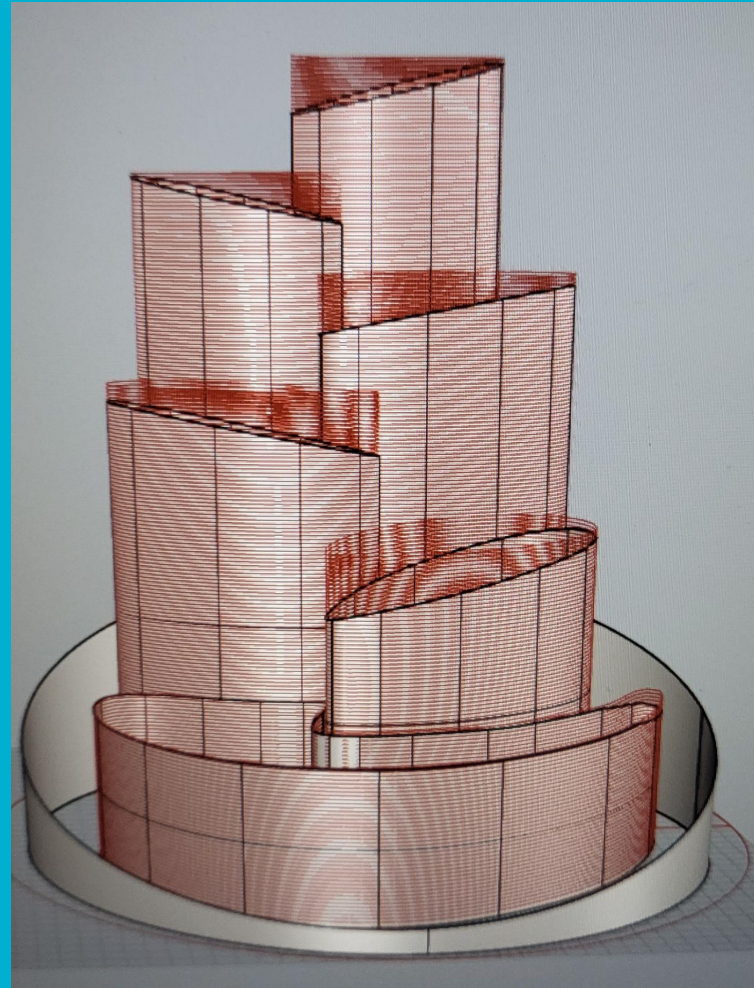

# Design phase

During the Seagrove trip I saw a small cup that had folding and pressed sides that form 2 vessels.

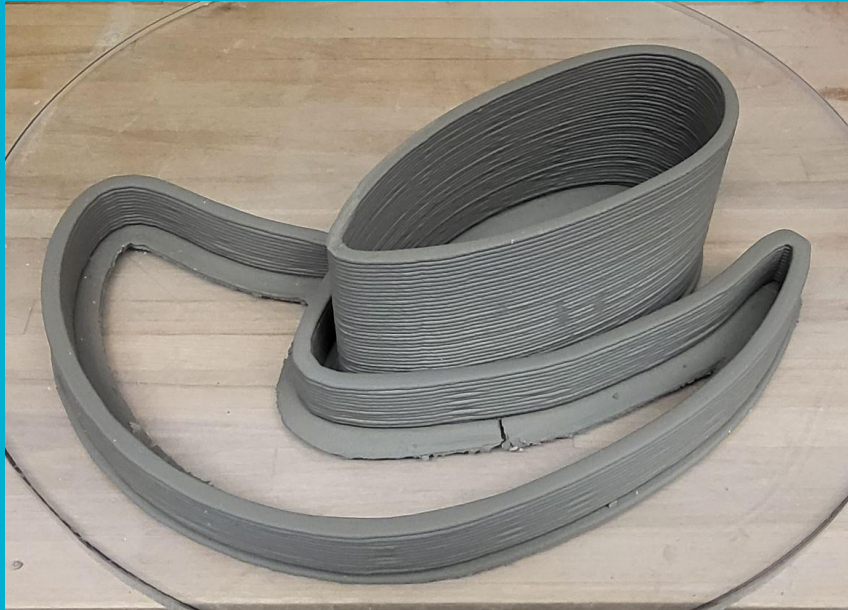

After seeing this I completely dropped my first idea of a bowl that dripped water into another bowl below it and wanted to work with this idea.

The script was very hard to work with to form the multiple shaped vessels in one pass so I changed my plan to be individual towers that flowed water from one into the next.

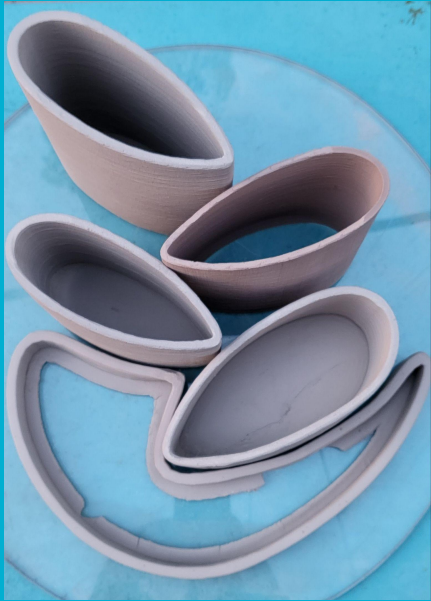

# Print

The red clay did not prove to be my friend since aout of 6 prints only part of one survived, thus all remaining prints were done in white clay.

# Final print results

Once the clay had a few days to dry out I sanded the tops at an angle in hopes that the water will flow out from the vessels.
